All data is based on Canon's standard testing methods.

Subject to change without notice.

[2] Requires optional paper cassette PCC-CP400 [3] To test the image permanence of prints that are stored in an album, we use an accelerated testing method similar to how the image permanence of silver-halide photo papers are measured when stored in dark places. Print samples are printed with the optical density of 1.0 (each Bk, C, M,Y). The samples are kept in a certain environment of high temperature and 50% humidity. The rate of the decrease in the optical density and rate of yellow discoloration are recorded. The recorded results are then converted to the length of time when print image is kept in an environment of 23oC/ 50% humidity. <Criteria for estimation of print longevity> 'The point where monochromatic/ reflective optical density shows loss of 30% (starting density of 1.0). [4] Print speed can vary dependent on data size, print method, memory card and capacity and is measured from start of printing excluding paper handling [5] Modes/features available may differ dependent on camera model or use of memory card to print [7] Requires adapter (sold separately) [13] Irregularly sized images, or images that have been edited on a computer may not display or print. USB Devices that are not identified as "Removable media" (such as external hard drives) or do not use the FAT or exFAT file system or have GUID partition tables created on a Macintosh computer are not supported.
